SWAPSTREET

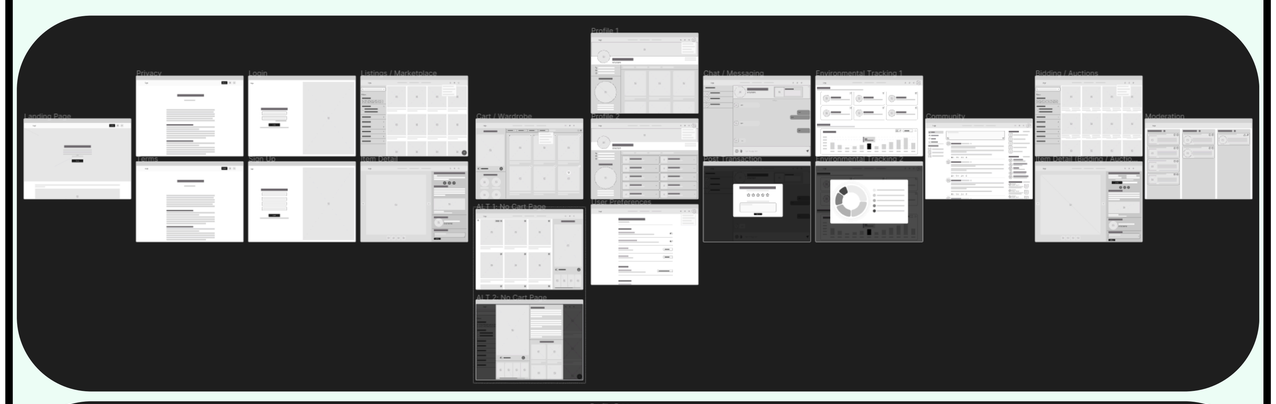
Overview

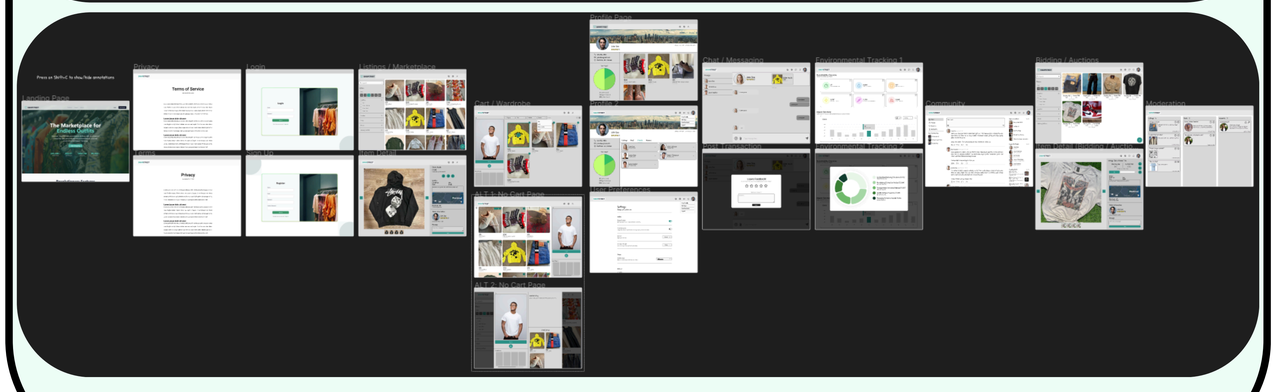
This project is a web and mobile marketplace for buying and selling refurbished and second-hand clothing. It aims to make fashion more affordable while promoting sustainability.

The platform allows sellers to create listings with photos, descriptions, and condition ratings. At the same time, buyers can browse using filters and collections for a user-friendly and engaging experience.

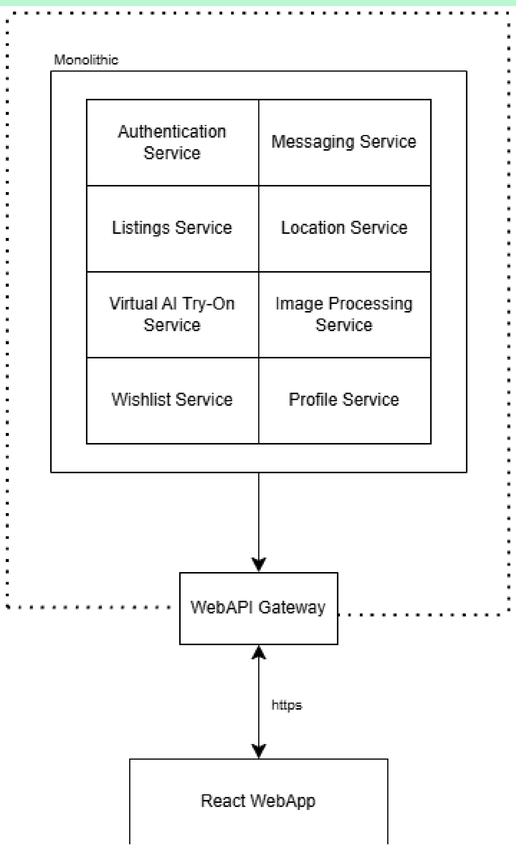
The platform also includes features such as AI-powered virtual try-on, secure payment procedures, seller feedback and reputation, in-app messaging, notifications, wishlists and a sustainability tracker that highlights the environmental impact of purchases.

UI/UX

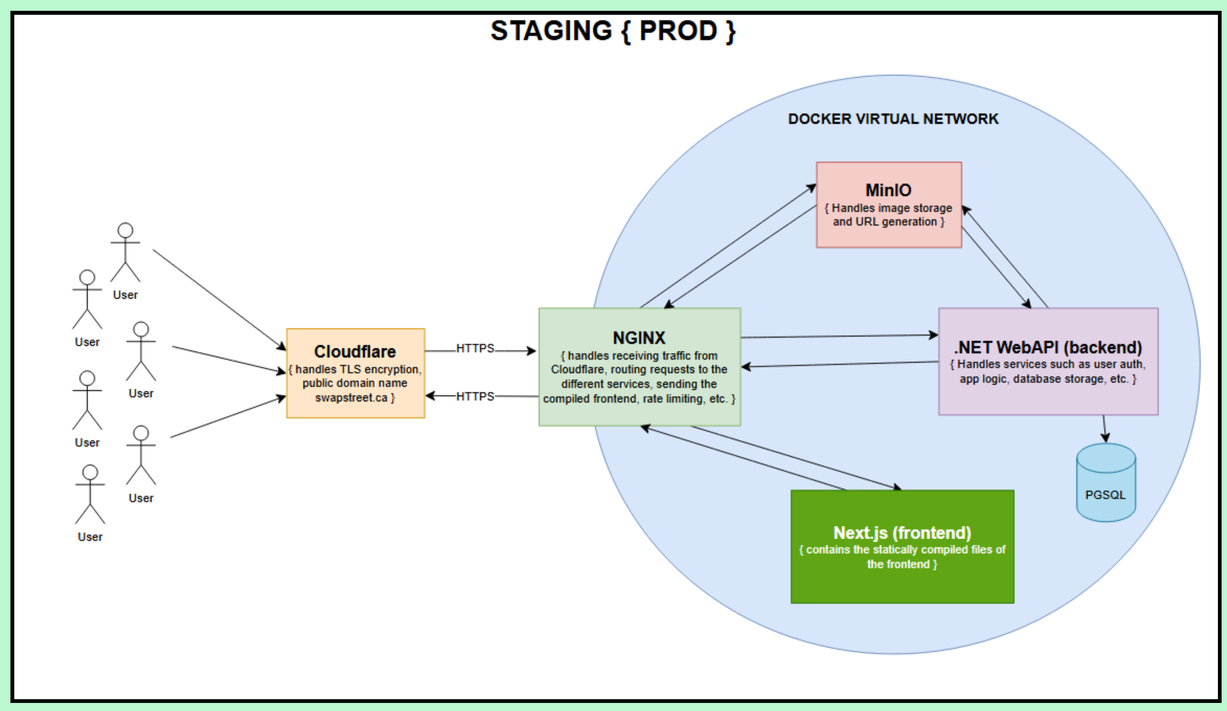




Architecture



Deployment



Safety & Privacy

The platform prioritizes user safety and privacy by protecting personal data through secure data handling practices. User interactions are supported by a transparent feedback and reputation system, and privacy-focused design minimizes the sharing of sensitive information.

Environment

The platform promotes sustainable fashion by extending the lifecycle of clothing and reducing waste. A sustainability dashboard lets users track CO_2 savings, gallons of water and kWh of electricity saved, textile waste, dye chemicals avoided and land preserved, while showing both individual and global platform impact.
